19	TD-	Transmitter Inverted DATA in. AC Coupled. CML- I
20	VeeT	Transmitter Ground (Common with Receiver Ground)

Note

1. Circuit ground is internally isolated from chassis ground.
2. TX Fault is an open collector/drain output. Which should be pulled up with a 4.7K – 10K Ohms resistor on the host board if intended for use. Pull up voltage should be between 2.0V to Vcc+0.3V. A high output indicates a transmitter fault caused by either the tx bias current or the tx output power exceeding the preset alarm thresholds. A low output indicates normal operation. In the low state, the output is pulled to <0.8V.
3. Laser output disabled on TX Disable >2.0V or open, enabled on TX Disable <0.8V.
4. Internally pulled down per SFF-8431.
5. LOS is open collector output. Should be pulled up with 4.7k – 10kohms on host board to a Voltage between 2.0V and 3.6V. Logic 0 indicates normal operation; logic 1 indicates loss of signal.
6. Internally connected
